SUMMARY

Site reliability and platform engineer with 9+ years building, operating, and scaling highly available distributed systems across **34 production regions**, with deep focus on reliability engineering, incident response, and operations automation. Proven track record of treating operational problems as software, including eliminating recurring on-call toil from **10+ pages per week to 0**, improving incident resolution time by **20%** through automated alarm-context enrichment, compressing cloud region launch timelines from **30 days to 8 hours**, and lowering state-tier infrastructure usage by **68.4%** via health-checked live migrations. Deep expertise across distributed systems, infrastructure-as-code, Linux, cloud computing, monitoring and SLOs, capacity planning, and incident tooling, with strong ownership of high-stakes production services.

SKILLS

Languages : Java, Python, Shell Scripting

Cloud : Oracle Cloud Infrastructure (OCI), AWS, cloud computing fundamentals

Infrastructure As Code : Terraform, Ansible, Chef, Docker, Kubernetes, Jenkins, Linux, Git

Reliability & Platform : distributed systems, high availability, on-call & incident response, SLOs, capacity planning, operations automation, control planes, reliability engineering, REST APIs, Redis, SQL

Monitoring & Observability : Grafana, Datadog, MQL, JQL, alerting & SLOs

AI & Search Systems : RAG, vector search, BM25, Lucene, embeddings, agentic workflows

EXPERIENCE

Oracle India Development Center

2020 – Present

Member of Technical Staff

India

- Cut access- and setup-related on-call pages from **10+ per week per UK–India shift to 0** by exposing secure public management APIs, removing tunnel dependencies, and enforcing tenant validation, RBAC, IP-based restrictions, and mTLS ingress.
- Saved **203.5 engineering hours** within API Gateway and improved incident resolution time by **20%** by automating Jira alarm-context enrichment across **2,442 tickets**; onboarded **6 teams** to the workflow.
- Built the Ops Copilot RCA subsystem now used by API Gateway on-call to auto-root-cause alarms covering roughly **80% of on-call load** at **80% accuracy**, combining ticket context, logs, metrics, and LLM reasoning; redesigned it into a shared background workflow with Object Storage reuse, saving **11.7 engineering hours per month** on Sev2/Sev3 follow-up.
- Designed and built the Jira Severity Controller that turns API Gateway service logs into automatic customer-impact assessment during the incident window — a key input to an autonomous SRE agent — with dry-run mode, alarm whitelisting, config gating, evidence trails, and re-escalation when impact surfaces later.
- Eliminated a recurring on-call page by replacing static alarm thresholds with **binomial probabilistic threshold analysis**, sizing per-region thresholds to fire on true positives while suppressing false positives and reducing false alarms by **13 per month**.
- Cut state-tier capacity footprint by **68.4% in OC1**, eliminating **357 cores** and reducing large-region usage from **63 OCPUs to 18 OCPUs per region**, by building an 8-step automated live-migration workflow for Redis-based state services with strict sequencing, health checks, and production guardrails.
- Reduced OCI API Gateway new-region and new-realm build time from **30 days to 8 hours** by redesigning the build workflow, replacing ticket-driven dependencies with Terraform-based automation, and streamlining policy serialization and tenancy-aware provisioning.
- Led ARM adoption and mixed-shape platform validation across **34 production regions in 4 rollout phases**, enabling API Gateway services to run across x86 and ARM while addressing capacity bottlenecks through performance testing, shard sizing, and staged production rollout.
- Modernized the API Gateway performance-testing stack by migrating the entire suite from legacy Canary to Test Service, upgrading to **Java 21** and a new testing framework, and building the supporting infrastructure; retired legacy instances, resolved recurring security-review findings, and avoided more than **300 security tickets** across **34 production regions**.

- Re-architected the Orchestrator admin plane with a production-ready V2 API spanning **16 named resources** (DTOs, custom cursor pagination, Forge/SPLAT role-protected access), replacing fragile tunnel-based patterns; running in production since **2025 with no known defects** across commercial and government realms, and onboarded to **OCI-OPS CLI** so operators administer the service through standard tooling.

UnitedHealth Group

2017 – 2020

IO Engineering Analyst

India

- Automated end-to-end Pega installation with Python and shell scripting, cutting per-server setup time from **11 hours to 30 minutes** and removing approximately **95%** of manual effort; recognized with the **Aquamarine Bravo Award for Innovation**.
- Built customized containerized Pega images on JBoss and Tomcat with MySQL for OpenShift deployment, advancing the platform's containerization strategy and enabling repeatable environment provisioning.
- Designed and deployed a three-tier high-availability web application using Apache HTTPD, Tomcat, and Prevayler, with auto-scaling and configuration management delivered through Docker, Docker Swarm, and Ansible.
- Saved **more than 30 hours of manual work per month** by automating certificate rotation, renewal notifications, and roll-out workflows with Ansible and Python.
- Cut go-live environment validation time by **2.5 hours per environment** by automating health checks across JBoss, WebSphere, and IHS with shell scripts that generated spreadsheet-based readiness reports.

KEY ACHIEVEMENTS

- Scaled Ops Copilot from a passion project into a senior-leadership-recognized operations platform adopted by **15 teams**, driving **hundreds of hours of monthly time savings** through AI-assisted troubleshooting, ticket enrichment, and reporting automation.
- Turned an API Gateway Catalog proof of concept into the foundation for a broader API Developer Portal initiative, strengthening internal developer enablement and platform self-service.
- Recognized with UnitedHealth Group's **Aquamarine Bravo Award for Innovation** for building a repeatable Pega installation workflow that replaced a lengthy manual process with fast, standardized server provisioning.
- Recognized as a go-to engineer for AI adoption and operational best practices across API Gateway — running regular workshops and presenting reliability, RCA, and automation work in org- and leadership-facing forums — with designs reused by on-call and partner teams.

EDUCATION

Dayananda Sagar College of Engineering

2013 – 2017

B.E. in Information Science

Bengaluru, India
